

PREMIUM PRO GARAGE DOOR WASH & WAX PRO INSTRUCTIONS

Recommended for Metal Garage Doors

Mix 3 ounces (10 capfuls if you don't have something to use for measuring) 3 ounces in a 5-gallon bucket will be enough to clean a standard 16' x 8' (128 square ft.) size door.

Using a regular garden hose, spray the door well to remove loose dirt and debris. (**do not use a pressure washer**).

Wash door thoroughly, we recommend starting at the top and working toward the bottom washing downward. Wash door completely, rinse thoroughly with water then dry well with a non-abrasive towel.

You are now ready to apply Ceramic Coat Pro spray wax to the door. If you have not already, we recommend applying twice a year, more often if you are near coastal/beach areas.

PREMIUM PRO CERAMIC COAT PRO SPRAY WAX

For use on Metal garage doors. **Do not apply in hot direct sunlight.**

Wash the door before applying. Use Premium Pro Wash & Wax, it will clean all the dirt and dust off the door. A clean door is a must before spray wax application. After washing the door, it is a good idea to run the door up and down a few times. This will help get rid of any excess water from between the door sections, plus perimeter weather seal on the door jamb and header. They can trap a little water that can drip while you are applying spray wax. Now dry door very well with a clean non-abrasive cloth. You are now ready to apply spray wax.

Spray the wax directly on the door. Using a clean, soft cloth or microfiber towel, rub the wax onto the door surface back and forth as you are wiping away the wax. This will leave a protective coat on the door. Work a section at a time for best results, we recommend starting on the top section of the door working left to right or right to left. Working a few feet at a time on each door section seems to work the best. We suggest waxing the door at least 2 times per year. One 16oz. bottle is enough to do a 16' x 8' size garage door (128 sq. ft.) twice a year.
